

A global shift to a plant—based diet could reduce mortality and greenhouse gases caused by food production by 10% and 70%, respectively, by 2050.

Animals farmed for meat and dairy consume 5 times as much food as all human beings. If this food was given to humans instead, we could end world hunger. The world already produces enough food to feed 10 billion people, yet much of it goes to livestock production.

By eliminating our consumption of animal products, we can stop the rapid depletion of Earth's resources, slow the threat of climate change, and help protect our planet for generations to come.
